Sustainable agriculture is farming that uses fewer resources to produce food. These farmers, for example, don't use fertilizers or toxic pesticides, or any genetically modified seeds. Environmental sustainability, energy efficiency, and improved health and well-being are all part of the picture. "The Sustainable Agriculture Initiative – NACSA's report is the first ever independent assessment of the current status of financing U.S. sustainable agriculture," says Arjan Heinken, NACSA's president. "The numbers are very disturbing." There are many barriers to sustainability in U.S. agriculture, but the biggest obstacle may be the lack of financing. "With \$2.2 trillion in annual farm subsidies, the federal government should be providing direct and substantial support to U.S. sustainable agriculture," says Heinken. He says the federal government should also be offering tax incentives to farmers, ranchers, and other agricultural producers who want to adopt sustainable practices. "Rural communities and small farms also need public policy support, to allow them to compete with urban, mono-crop, industrial farming. Farmers need access to federal and state financial markets to buy their inputs and to get the best prices for their products. This is the least we should be willing to do for those who dedicate their lives to producing food," Heinken says. In the meantime, we need to turn more farmers into business people. Heinken says farmers who want to explore the potential of producing food using a more sustainable approach should be able to access the same resources as those who already produce by the conventional model. "In addition to access to public policies, farmers should also have access to the best land, water, technology, and services." Heinken says. "Without these resources, farmers
